DETAILED ACTION

Remark

1. Claims 1-20 are pending for reconsideration, with claims 5-7, 11-14, and 17-20 are allowed in the previous office action; and claims 1-4, 8-10, and 15-16 are previously rejected.

Allowable Subject Matter

2. Claims 1-20 have been allowed.

Reasons for Allowance

3. The following is a statement of reasons for the indication of allowable subject matter:

The prior arts of record, either alone or in combination, does not disclose, teach or suggest a method of determining a home area for a subscriber terminal in a radio system wherein the method includes, *inter alia*, "... transmitting, from a base station, a command to the subscriber terminal after the location updating message has been received, wherein the command is to transmit the measurement results stored in the memory of the subscriber terminal; receiving the measurement results from the subscriber terminal; identifying the base stations with the greatest signal strengths at least partially based on the measurement results; and determining the home area of the subscriber terminal such that the home area includes at least one of the identified base stations ", as recited in independent claim 1, as amended. Further, the prior arts of record, either alone or in combination, does not disclose, teach or suggest a subscriber network element that includes, *inter alia*, "... means for transmitting, by a base station,

a command to a particular subscriber terminal which transmitted the location updating message after the detection of the location updating message, wherein the command is to transmit the *measurement results stored in the memory* of the particular subscriber terminal...", as recited in independent claim 8, as amended.

The prior art of record does not teach or suggest each and every feature of the present invention for a wireless local loop radio system comprising: a plurality of subscriber terminals including: measuring means for measuring strengths of signals received from different base stations and for storing measurement results in a memory, and transmitting means for transmitting location updates to other parts of the system; a subscriber network element configured to communicate with an exchange and including transmitting means for transmitting telecommunication signals between the subscriber terminals and the exchange via the base stations; detecting means for detecting a location updating message transmitted by a particular subscriber terminal; command transmitting means for transmitting a command to the particular subscriber terminal after detecting the location updating message transmitted by the subscriber terminal, wherein the command is to transmit the measurement results stored in the memory of the subscriber terminal; receiving means for receiving the measurement results transmitted by the subscriber terminal; identifying means for identifying the base stations with the strongest signals at least partially based on the measurement results received from the subscriber terminal; and determining means, responsive to the identification means, for determining a home area for the subscriber terminal such that the home area includes at least one of the identified base stations as claimed in claim 5 and similarly in claims 11, 14 and 17.
